

Verification POC Results

Email and Phone Risk Verification Batch Service
Analysis of [REDACTED] Inputs

Device Risk | Financial Services Industry

One Vendor.
One API.

Identify risk associated with emails or phone numbers with our new verification service that directly integrates into iovation's fraud prevention platform.

Critical Risk Integration Points

Enhance Your Ability to Identify Fraudulent Transactions

Account Origination

Assess the risk of submitted email and phone fields at the time of account creation

Account Management

Check changes to an existing email or phone number on an account, and validate the phone risk before sending a OTP

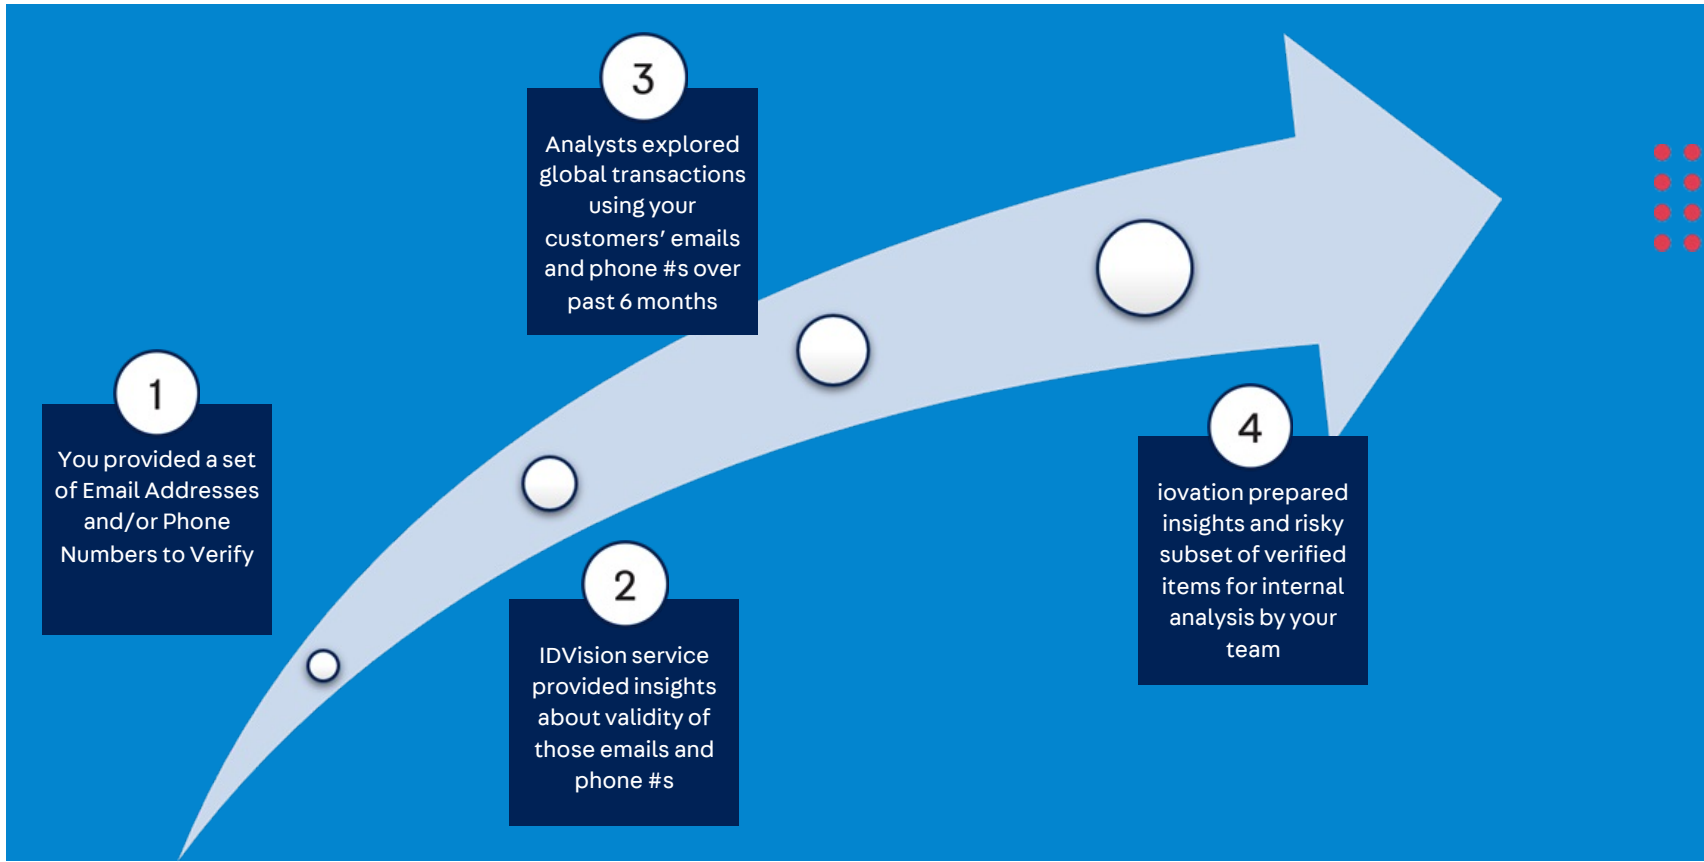

Checkout

Evaluate the risk of an email address and/or phone number at the time of checkout, especially on guest purchases

Analysis Process Explained

Understanding How Your Results Were Evaluated

Insights Gained

Examine Validity of Verified Inputs

Explore Global Activity with Other Subscribers in iovation Consortium

Highlight Global Device and Account Associations

Examine confirmed fraudulent and abusive behaviors linked to your customers' accounts

Understand Suspicious Online Behaviors Associated with your Customers

Consider Strategies to Target Unwanted Behaviors with Business Rules

*At the end of today's discussion, you will receive a PDF of this presentation, the raw data from the POC results, and a special list of risky email addresses and phone numbers for further internal evaluation.

Understanding the Data

The data shown on this slide summarizes the transactions processed from any and all iovation subscribers that have sent us your customer's email address or phone number with that transaction. The universe of transactions analyzed includes your own transactions, if you are currently sending transactions to iovation with an email address or phone number included.

When your customer's email address (or phone number) is processed by iovation, that particular customer has engaged online in activity that is potentially risky and requires device intelligence and machine learning to evaluate the level of risk. In many instances, the risk will be low or none. In other instances, your customer will have already been linked to confirmed fraud or abuse by an iovation subscriber.

By linking your verified email address and phone number to the devices they used and global accounts, we can provide insights about both customer behavior and validity of the verified items.

Terminology Overview

DENY, REVIEW, and ALLOW are transaction outcomes returned by iovation when evaluating a transaction. That result is dependent upon the subscriber's business rule configuration, level of risk present at the time, and the subscriber's risk tolerance for the targeted behavior.

In general, a DENY means that the transaction is stopped realtime and the customer journey ends there because it was a returning fraudster or there was too much combined suspicion present to proceed. A REVIEW means that there is an unacceptable level of suspicion present and a manual review of that transaction/account is needed before the customer journey can proceed. An ALLOW means there is no risk present or an acceptable level of risk for that integration point.

Email Verification Results

Identify Key Risk Indicators with Email

Age. Measure the time since our system first encountered this address

Validity. Assure that both the email address and domain are active and valid

Activity. 6 month lookback for high, medium or low activity across the validation network

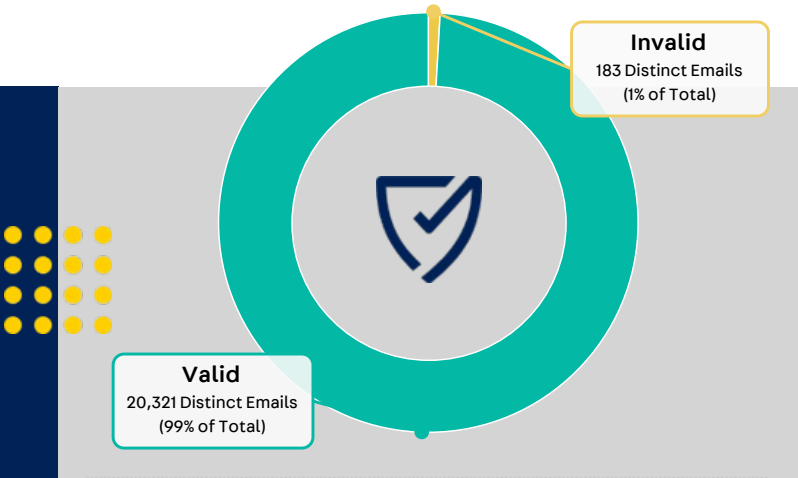

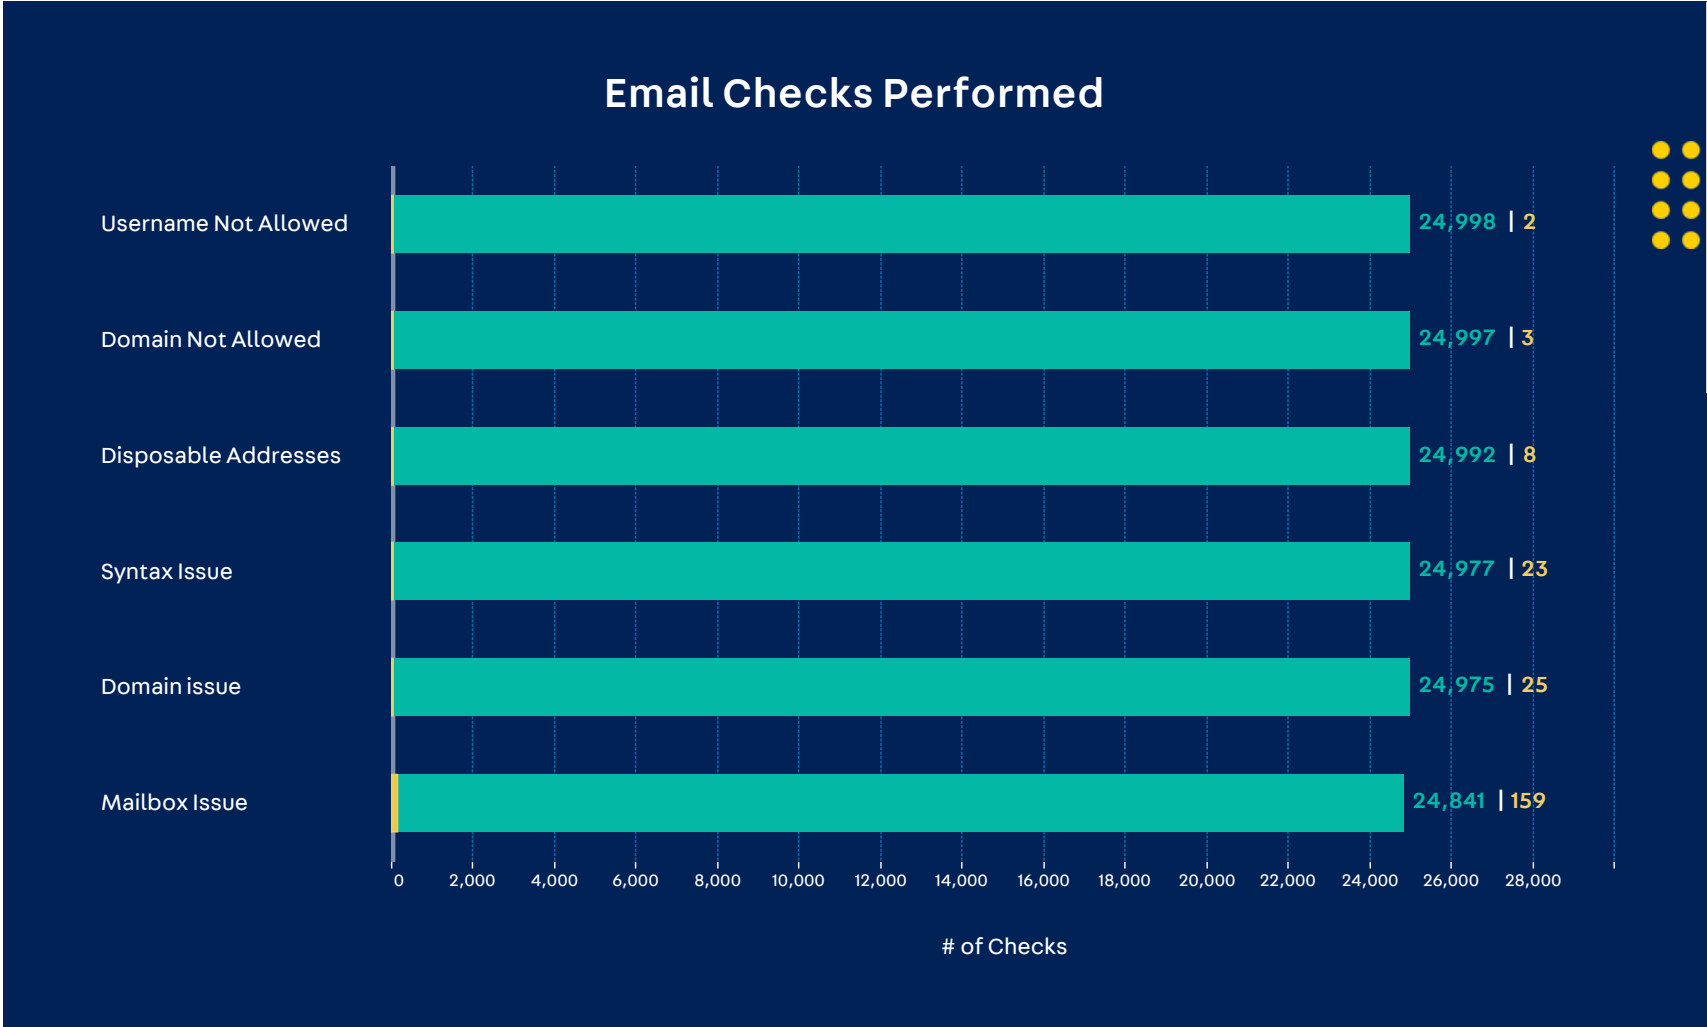

Popularity. 12 month analysis on high, medium or low number of sites

Email normalization keeps fraudsters from hiding their activity or popularity by using special characters in their emails

Overview of Email Validity and Domain

Multiple Checks Performed to Confirm Each Customer Entry

Email validation includes 6 different checks on the email address.

User and domain failures may indicate risk or may be a typo or user error.

Full integration includes business rules to confirm the validity of the email verified.

Email Domains and Popularity

Exploring Invalid Email Domains Used by Your Customers

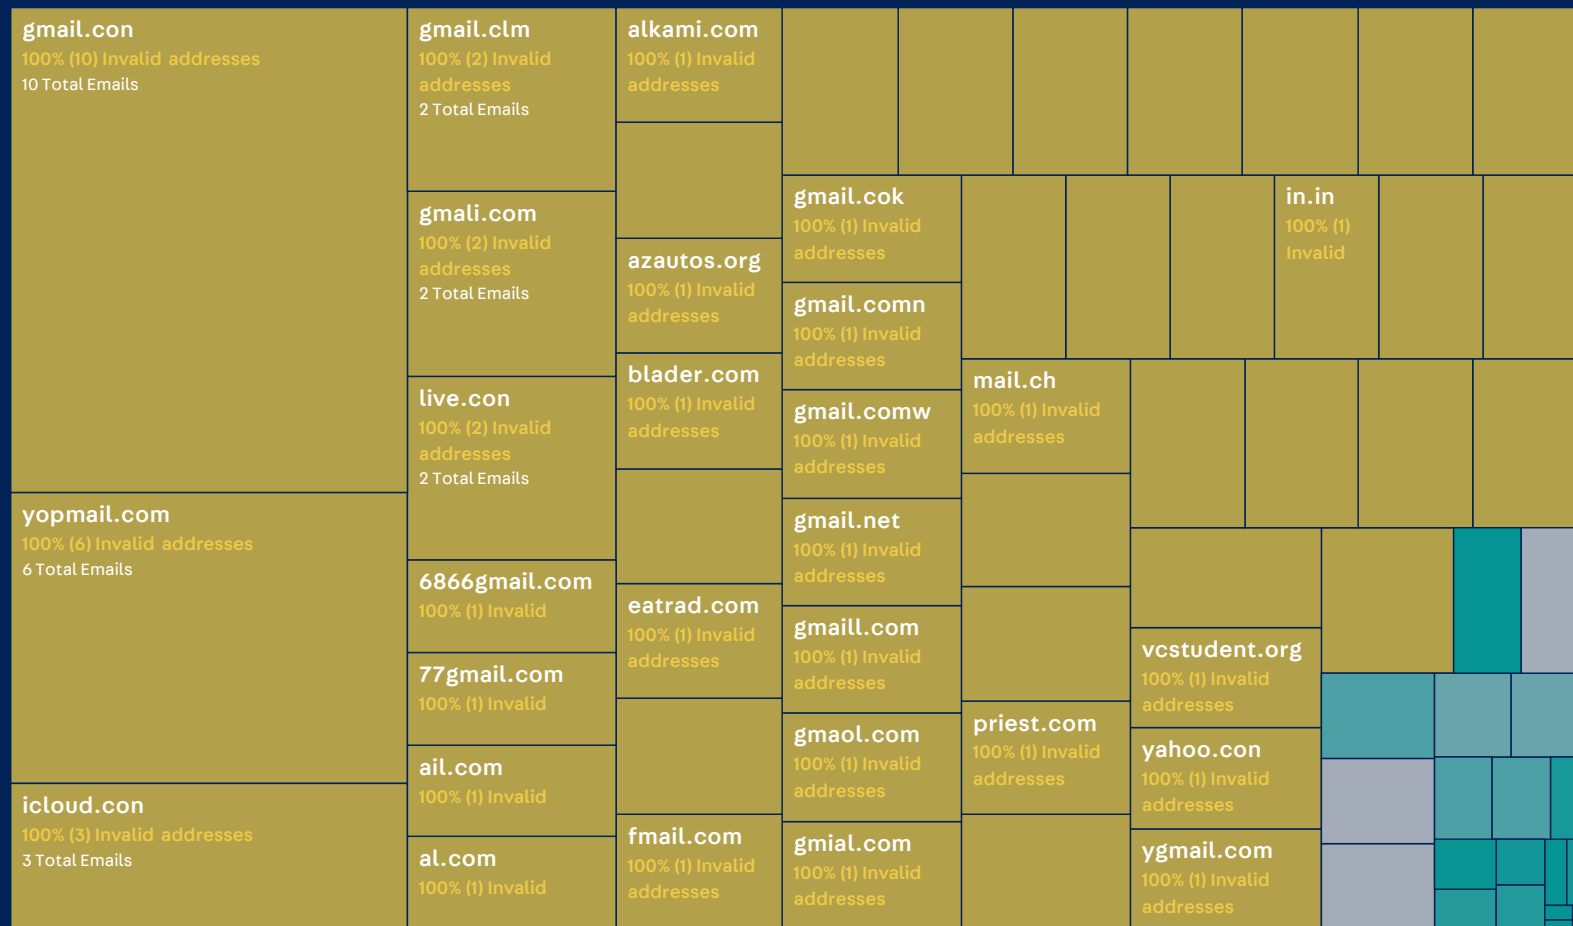

Select a domain to filter the list of verified emails flagged as invalid.

Overview of Age, Activity, and Popularity

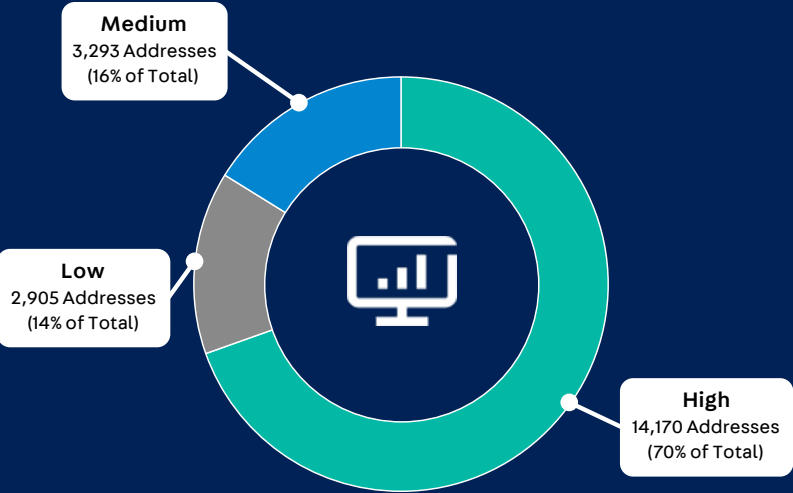

Summary of Distinct Email Addresses for Key Verification Fields

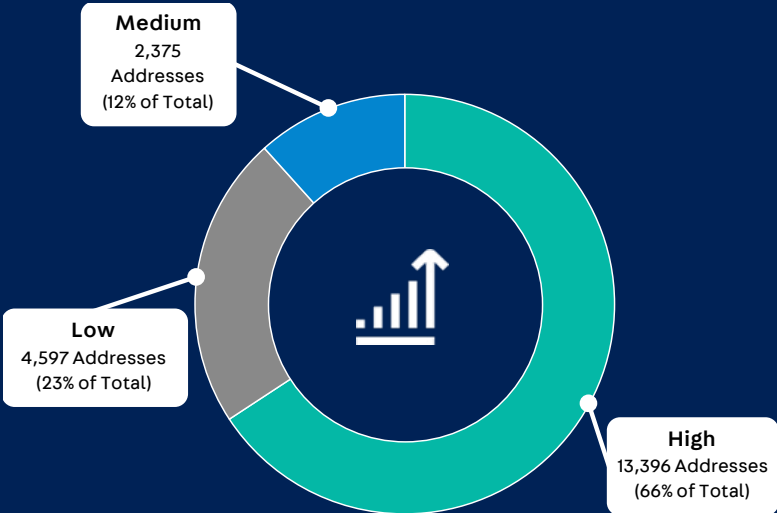

Email Age (Text)

Email Popularity

Email Activity (Velocity)

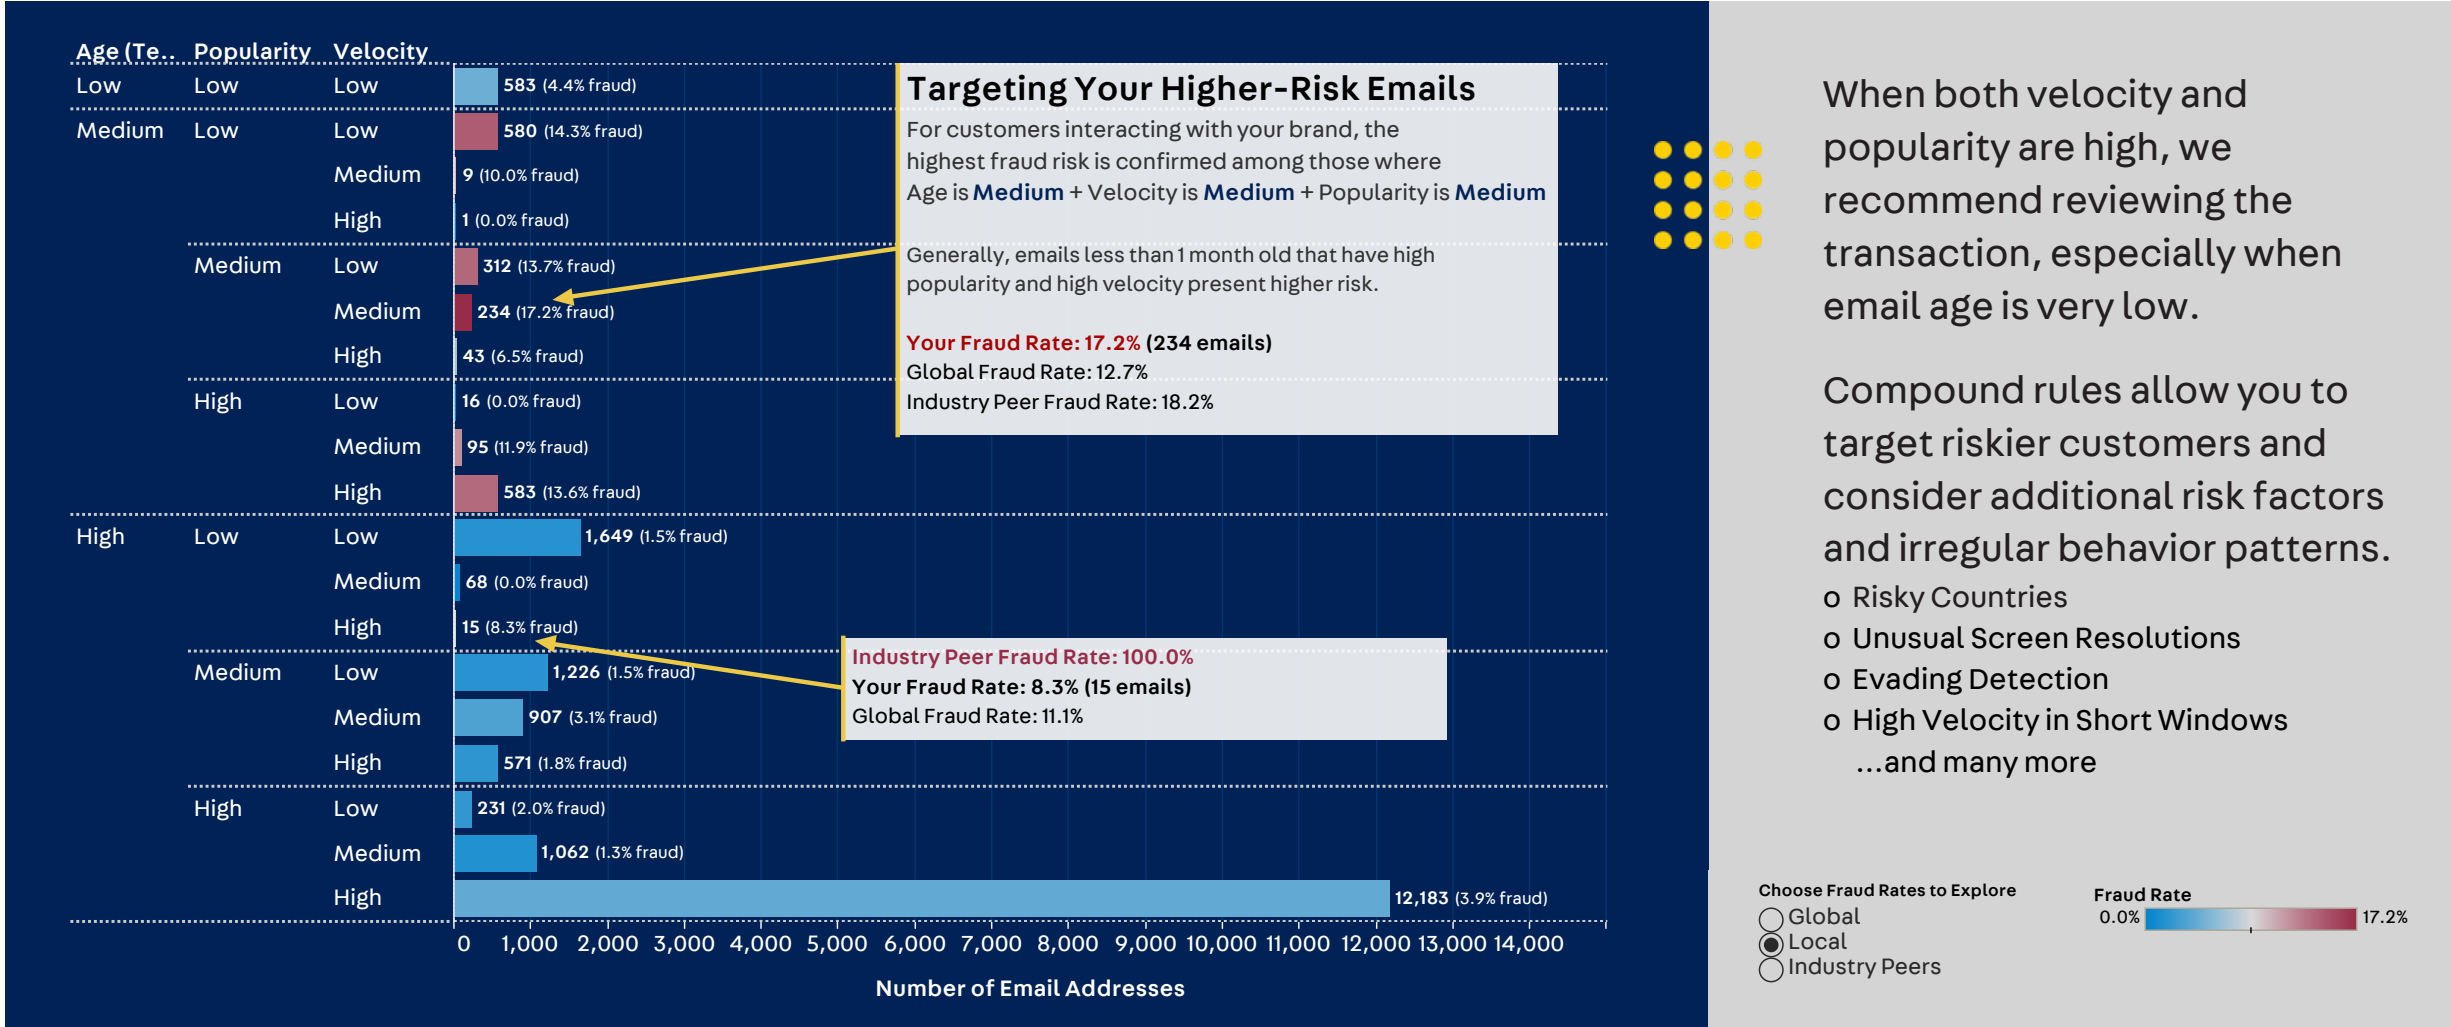

Emails provided ranged in age from 0 days to 13.9 years, with a median age of 89 months.

Activity and popularity can be used to segment or stratify the population for risk purposes.

High activity or high popularity may indicate a bot or automated traffic interacting with your brand.

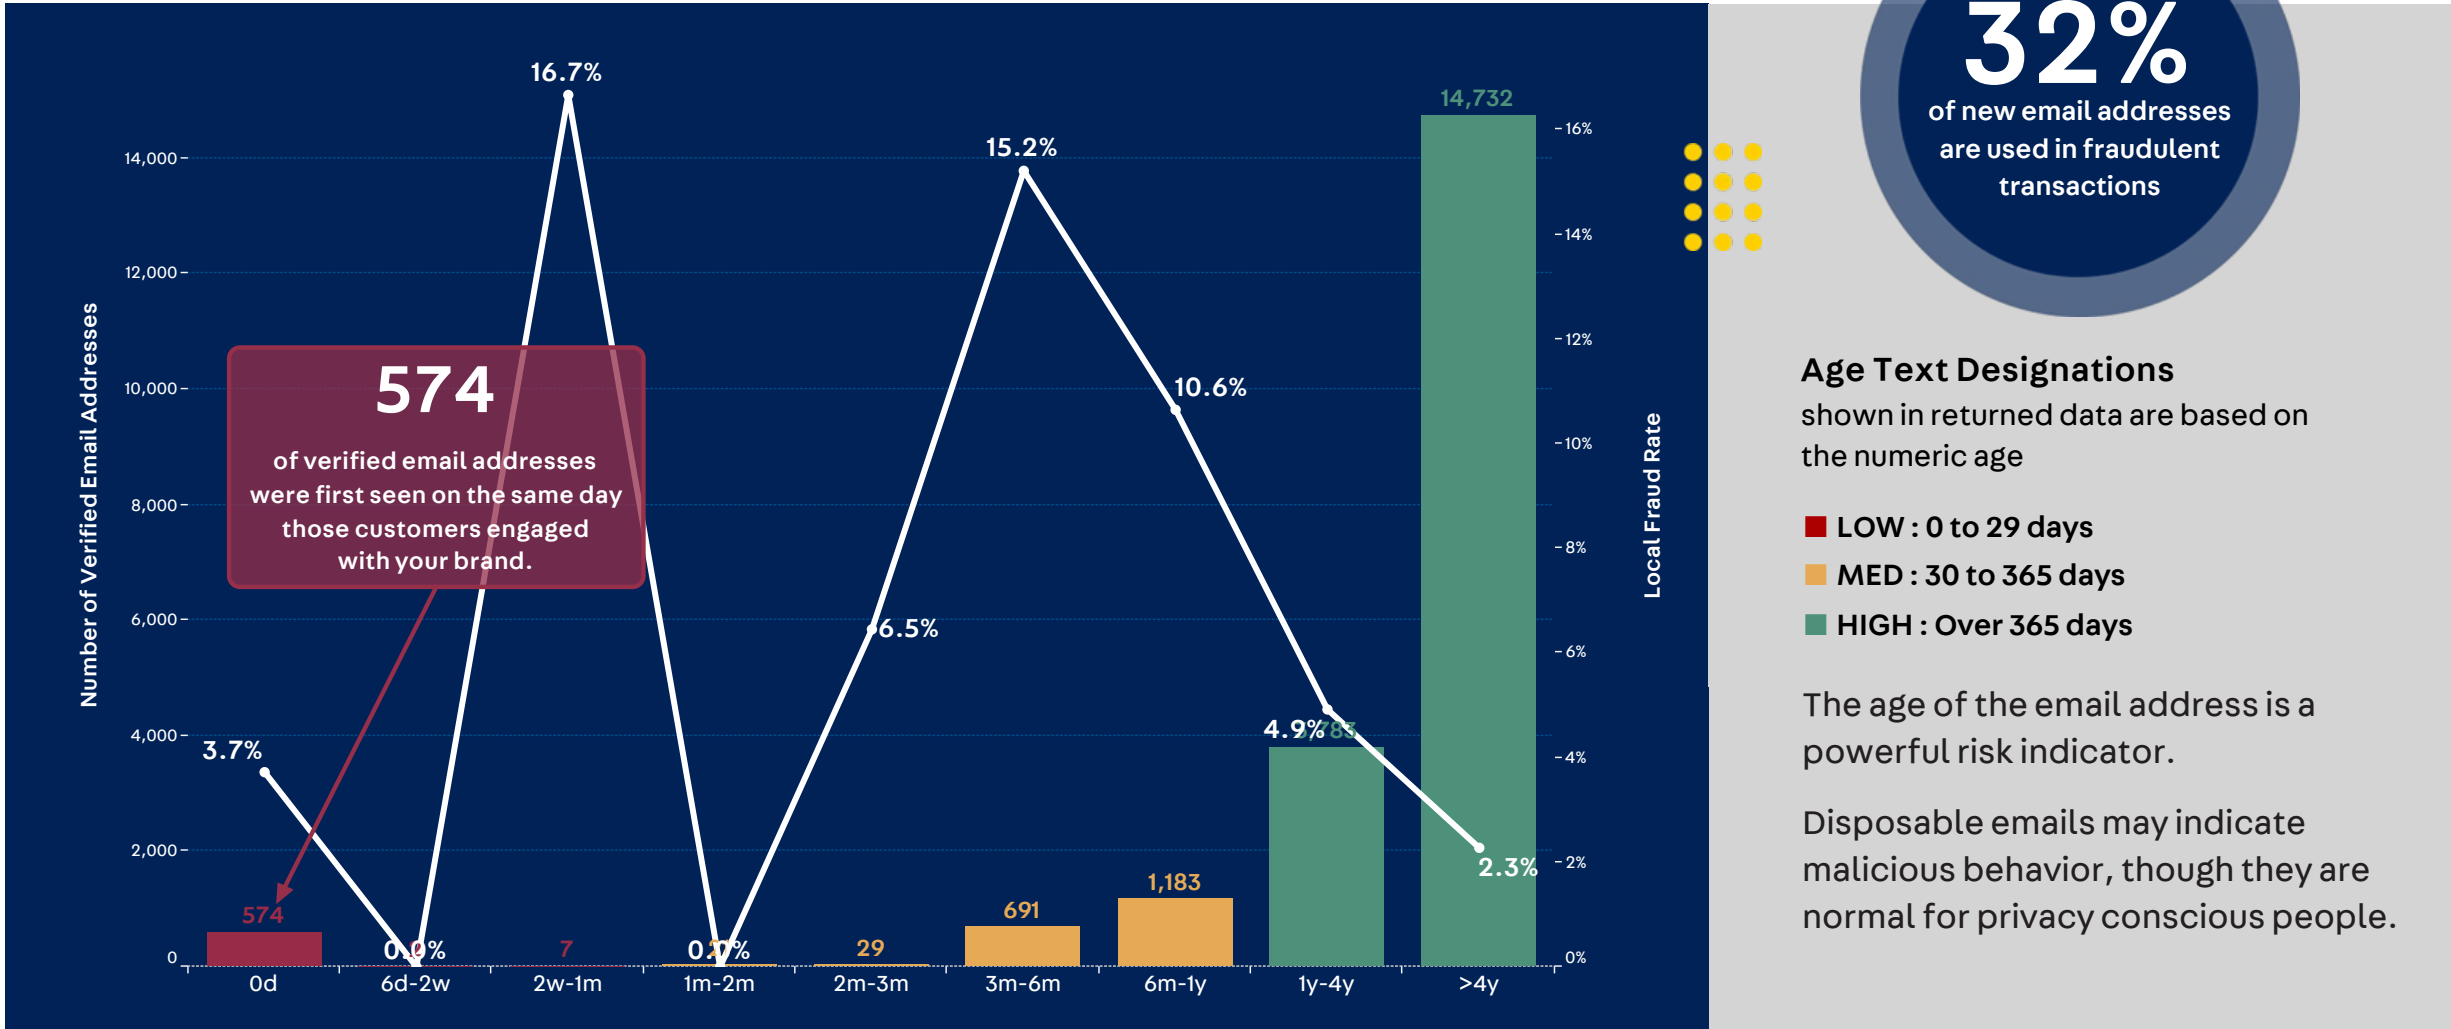

Combined Attribute Volume and Risk

Targeting Combination Volumes and Fraud Risk

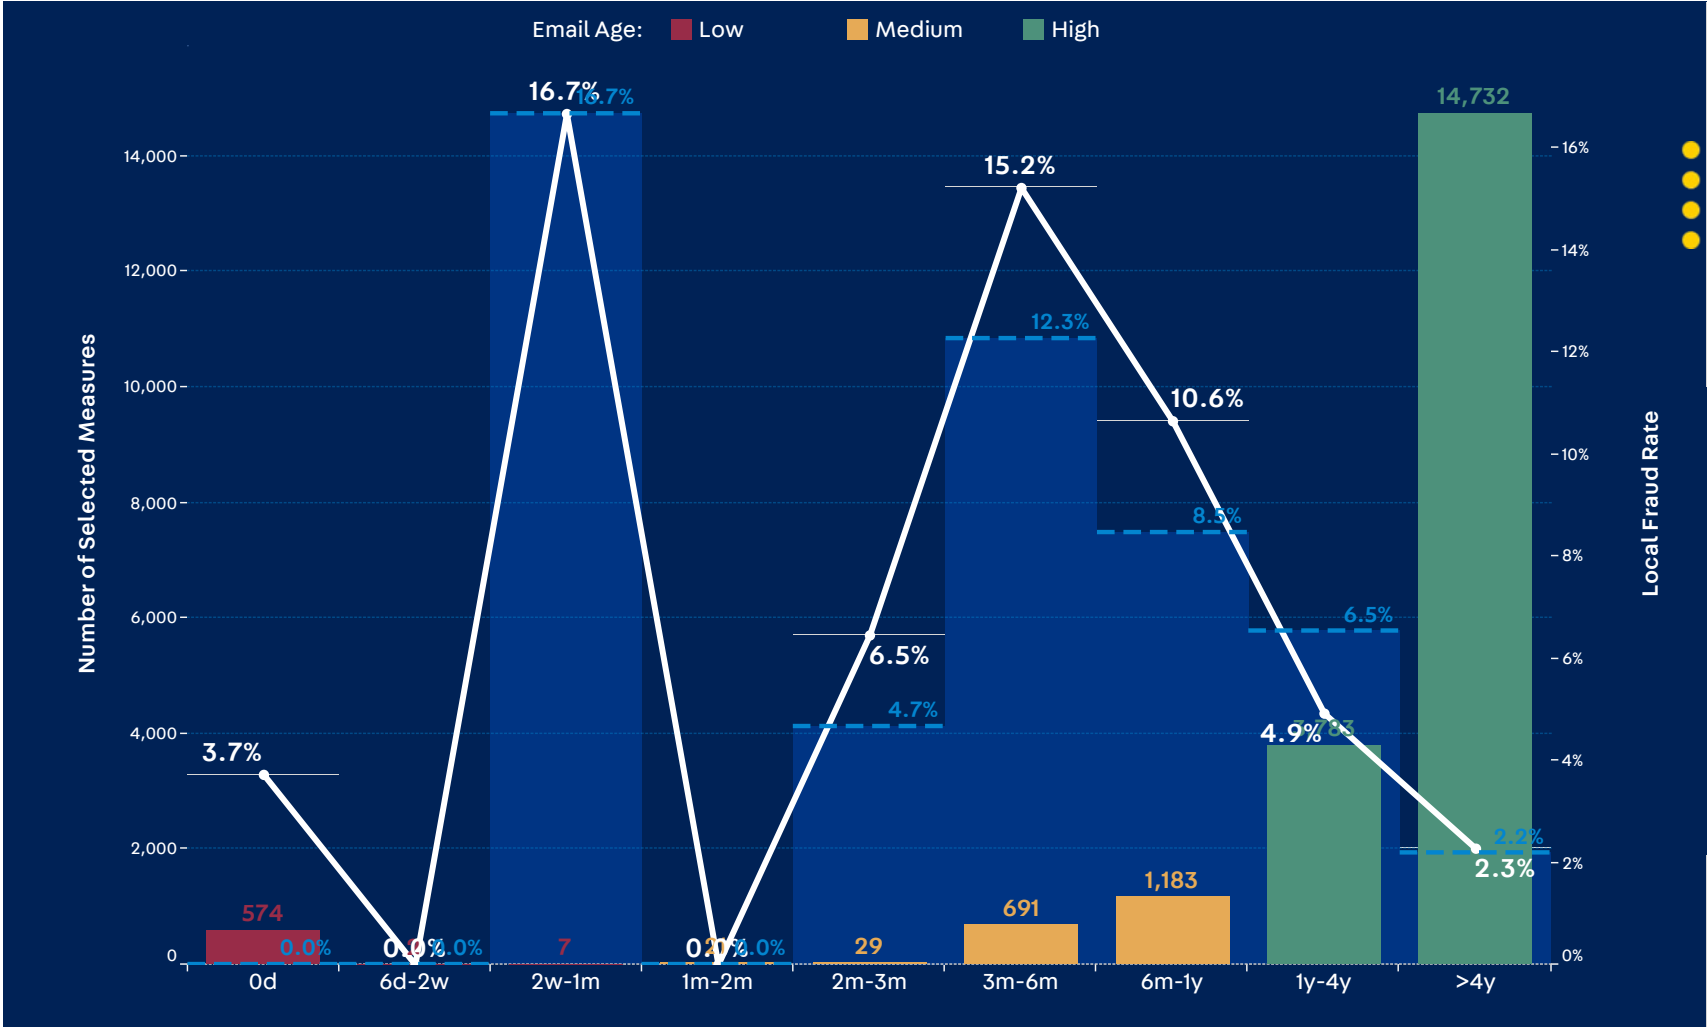

Email Age Distribution

Breakdown of Age Text Descriptions for Verified Addresses

Age and iovation Activity with Global Risk

Breakdown of Age in Days with Global Fraud Outcomes

Benchmarks Explained

The added blue shadow and dotted lines on the chart represent a fraud benchmark. It allows you to compare the fraud you confirmed to fraud your industry peers experienced when..

Age and Activity can be used to segment or stratify the population for risk purposes and separate customer journeys.

Low age and high global activity may indicate a bonus abuser or automated traffic.

Phone Verification Results

Aggregate a Phone Number Risk Score From Our Global Network

Reputation. Leverages a consortium of phone number risk to identify any history of suspicious network activity

Velocity. Identifies unusual traffic patterns, such as a number frequently showing up across the network

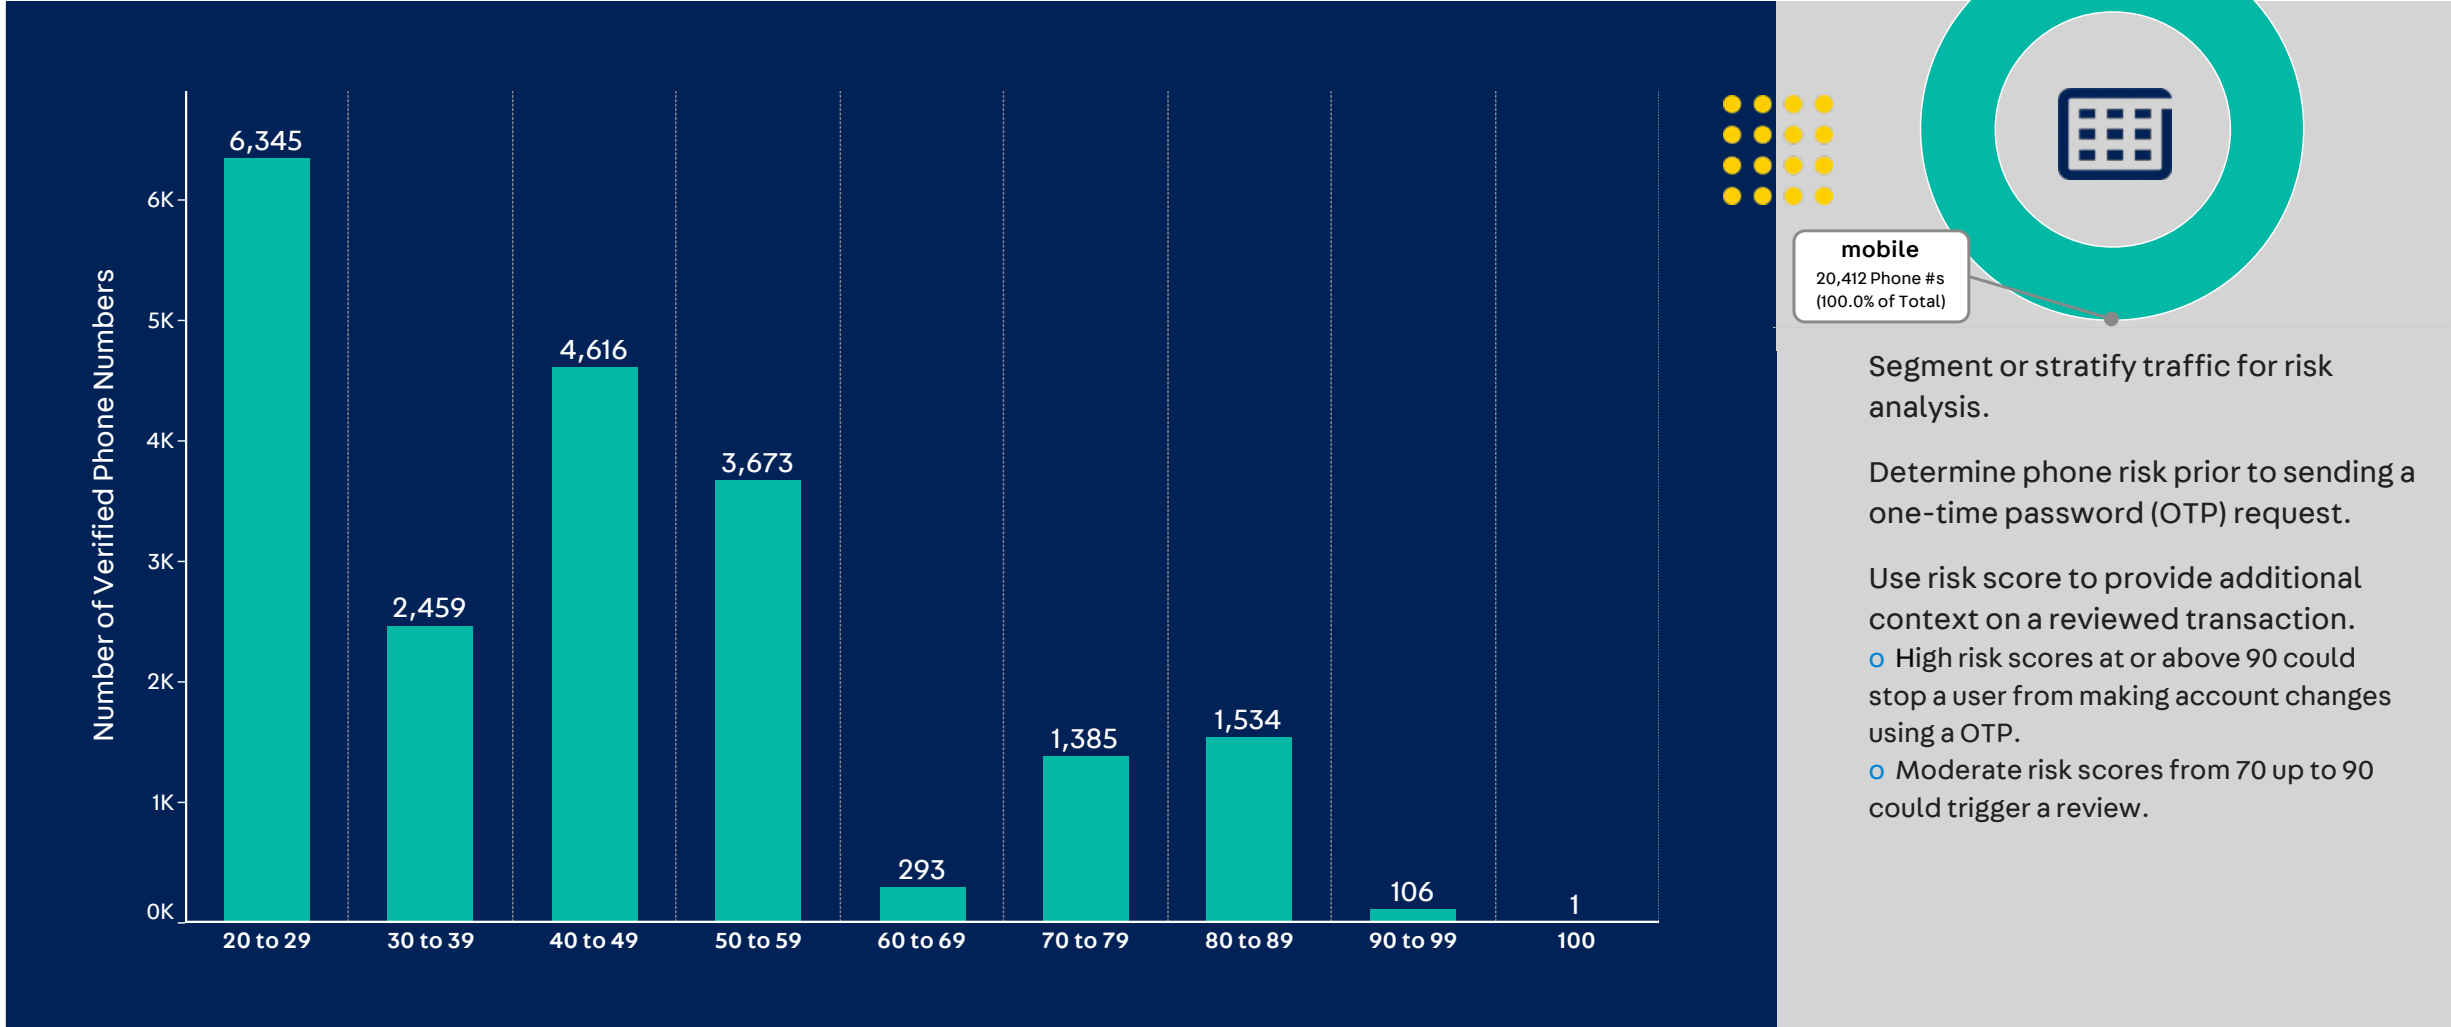

Phone Number Attributes. Evaluates phone data including phone type, telecom carrier, SMS capability, potential fraud

Traffic Pattern. Recognizes anomalous behavior patterns, like frequent activity from various geographic locations

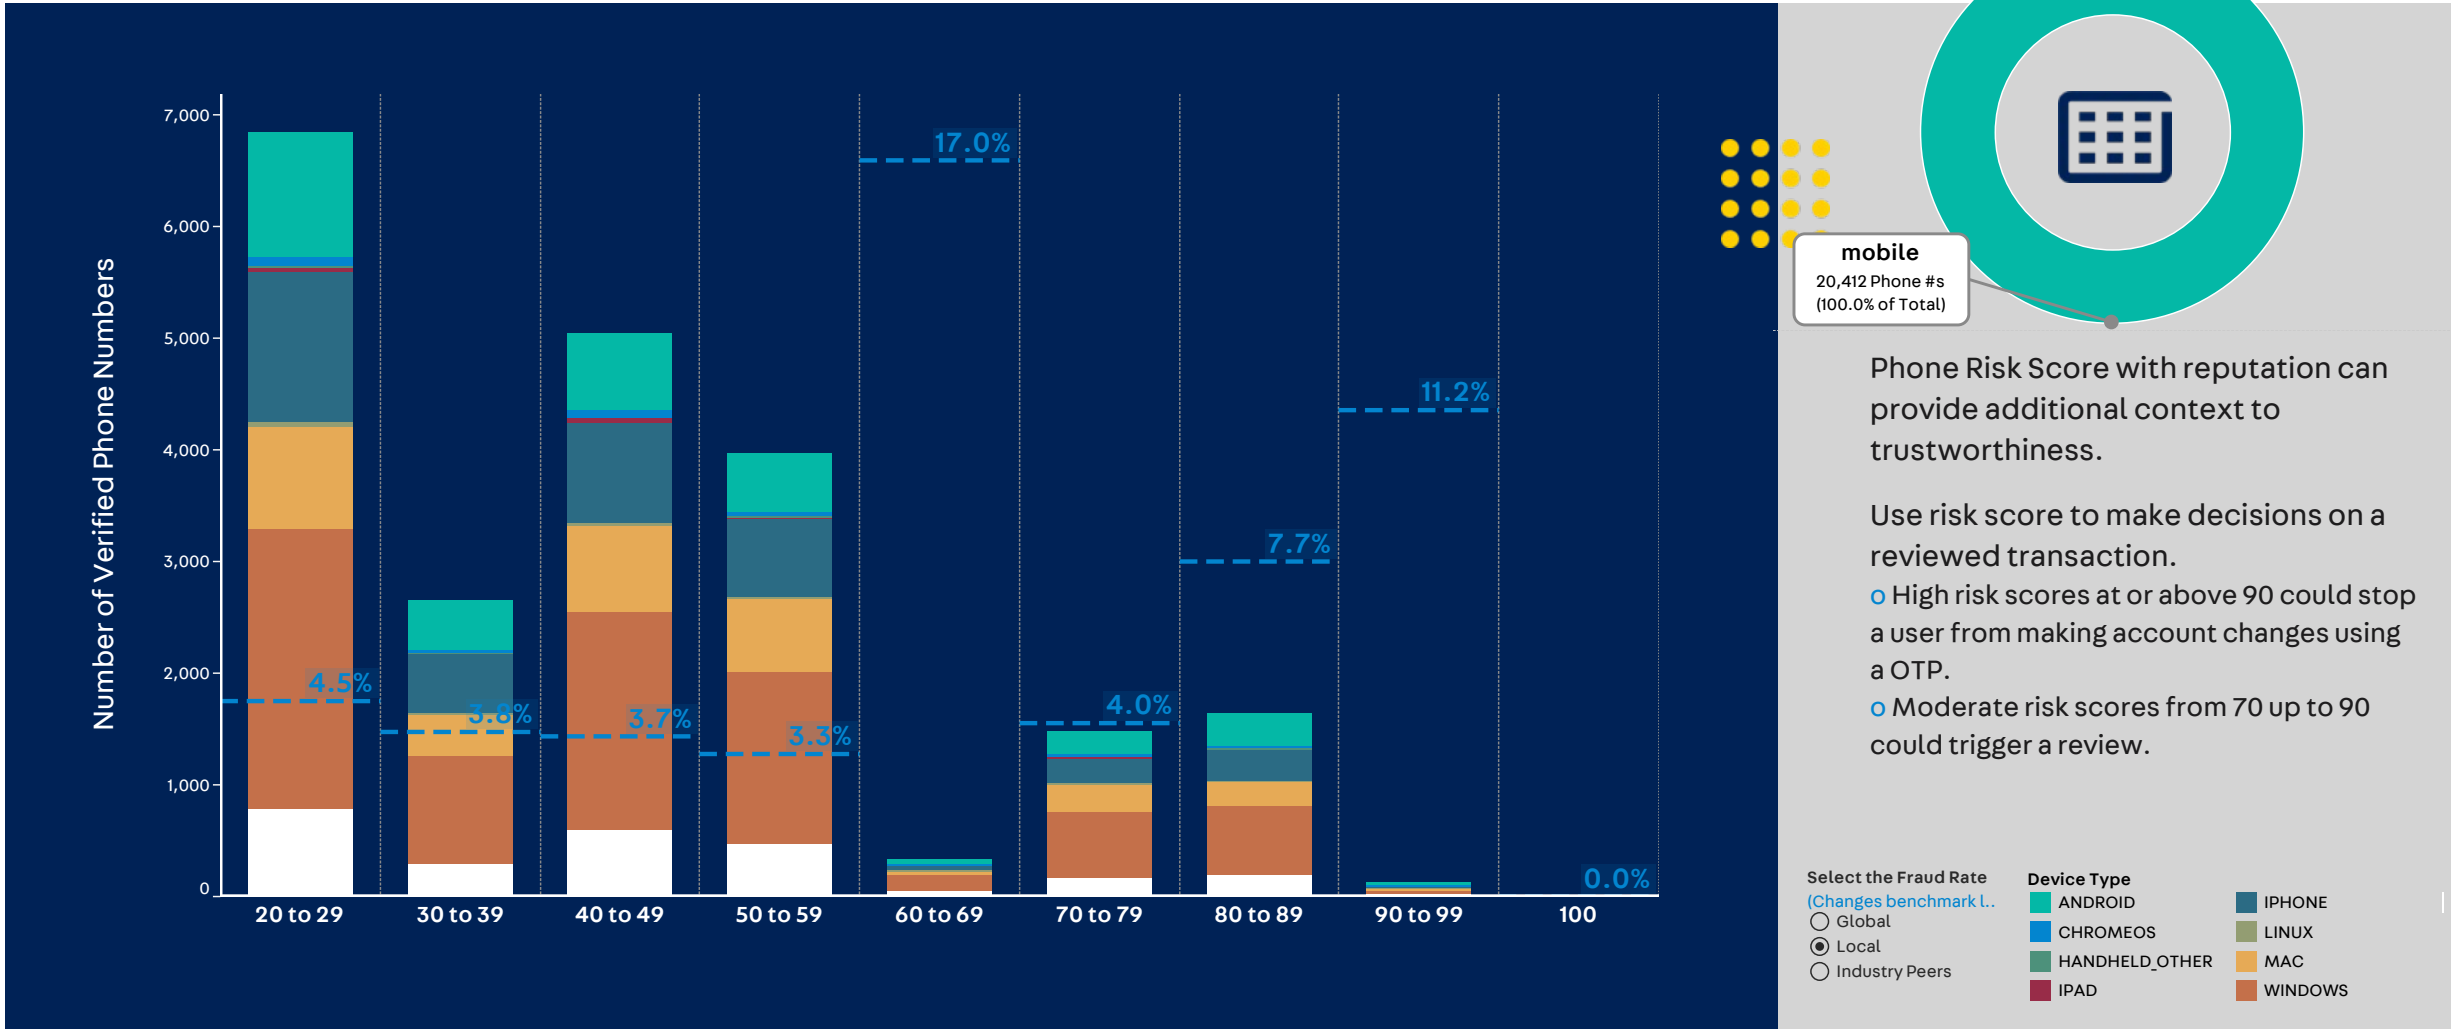

Distribution of Phone Risk Scores

Number of Phone Numbers by Type and Risk

Device Type Breakdown per Phone

Comparison of Risk Scores and Device Types

Local Phone Number Velocity Risk

Comparing Local & Global Number of Devices Associated with Your Customers' Phone Numbers

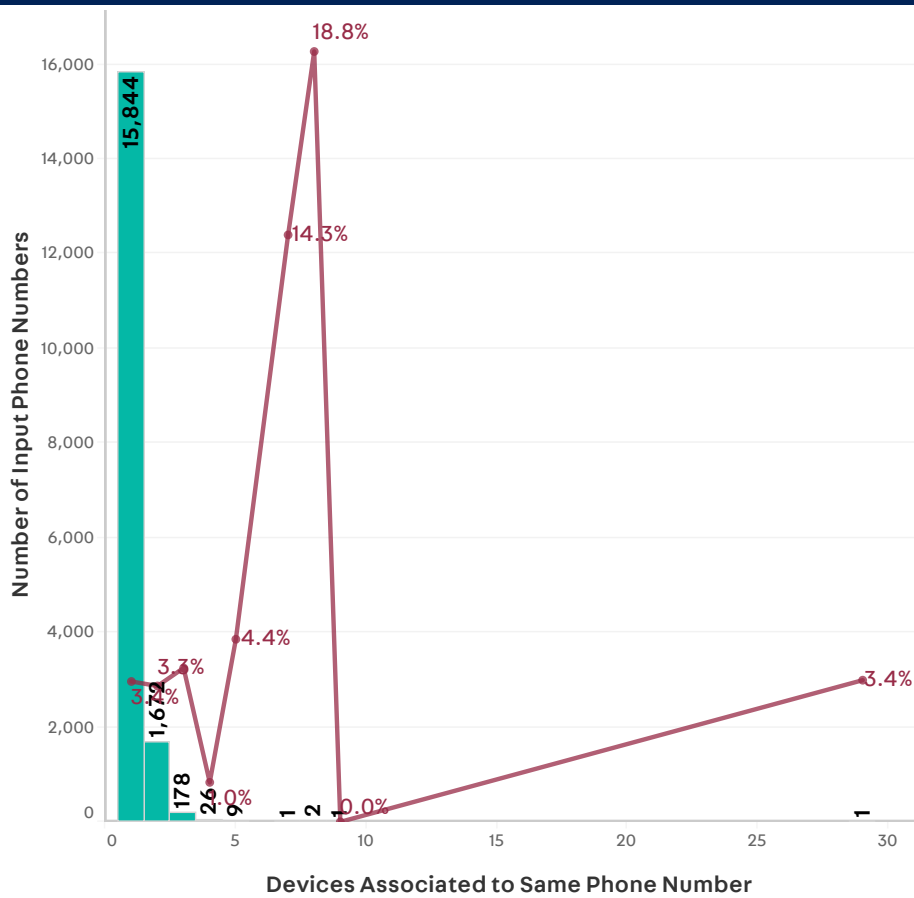

Phone Numbers per Device Distribution

Number of Input Phone Numbers Associated to the Same Device

Devices per Phone Number Distribution

Number of Devices associated to the same phone number

Understanding the Data

Phone number analytics like usage velocity can identify potential fraud risk. Velocity rules allow you to anticipate signs that a phone number is being shared and take appropriate action of whether to allow, block, or flag a transaction for further review.

Local Email Address Velocity Risks

Evaluating the Number of Devices or Accounts Associated with Your Customers' Email Addresses

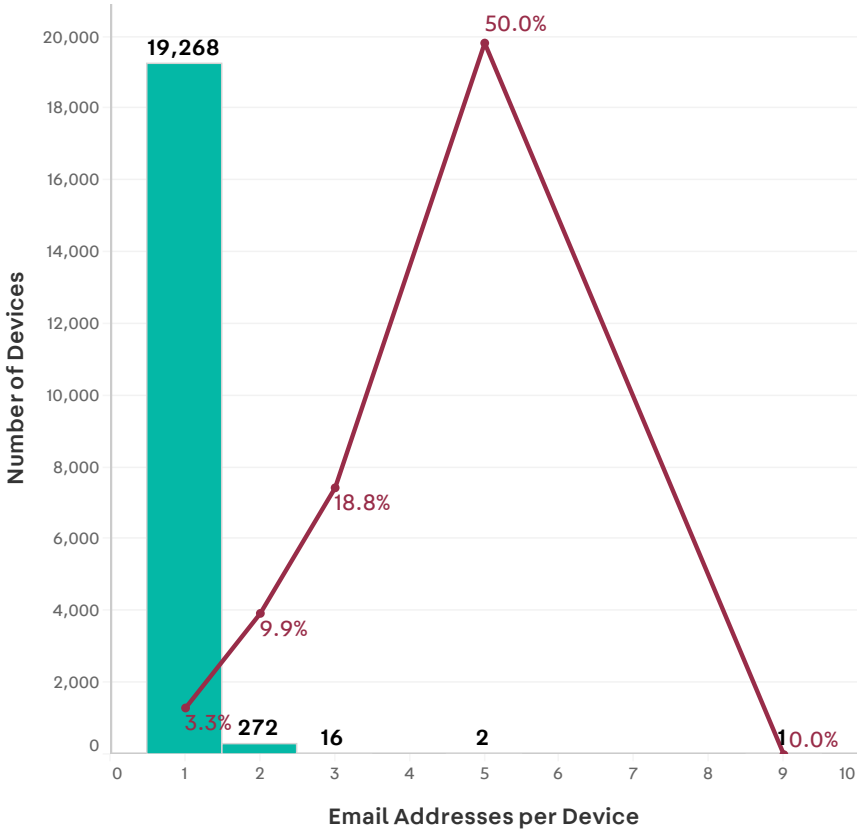

Email Addresses per Account Distribution

Based on accounts seen by Local subscriber(s).

Email Addresses per Device Distribution

Based on accounts seen by Local subscriber(s).

Understanding the Data

Anomalous traffic behavior patterns and usage velocity may raise red flags. You can use velocity rules to assess how frequently the email appears on your site in a small window of time. The current list of email addresses were associated to multiple devices globally during your POC period.

Geolocation Summary with Fraud Risk

Exploring Actual Locations for your Customers when Transacting Globally Online

Understanding the Data

Fraudsters frequently excel at hiding who and where they are. They change device properties between transactions to look like new, legitimate customers, and mask their locations and other risk factors during transactions to evade detection. Access to accurate and reliable device intelligence is critical to catching these fraudsters.

Botnet IP Risk Score Correlation to Email Age

Exploring Email Age Risks with Additional Transaction Attributes from your Verified Customers

Botnet IP Risk Score Correlation to Email Age

Exploring Email Age Risks with Additional Transaction Attributes from your Verified Customers

Understanding the Data

The relationship between the email age and the level of botnet risk for the IP used to transact online can be a powerful insight. Established emails used globally with high velocities or high botnet activity risk may indicate automated transactions meant to facilitate account takeover of your good, long-term customer accounts.

Machine Learning Optimization and Uplift

Exploring Risk Profiles Using SureScore in Global Activity of Your Verified Customers

Understanding the Data

SureScore uses advanced predictive machine learning to uncover trusted customers, improve the online experience, reduce costly step-ups, and prevent more fraud by exposing hidden risks. While the verified phone number and email address can be extremely valuable when assessing the customer's identity risk, SureScore provides a score on both new and returning customers based on all aspects of the transaction. Thus, our trust service helps you:

Decrease manual review queues as much as 40 percent by ensuring low risk transactions from legitimate customers aren't stuck in your review queue.

Create good user experiences by allowing your best customers to skip costly security checks while building loyalty with a frictionless customer experience.

Increase revenue opportunities by using trust scores at account creation to offer special promotions, or immediately convert a customer to a high status VIP.

Avoidable Manual Review Costs

5,953

Transactions

with a high SureScore range where the customer was delayed by manual review. Our proprietary trust score ensures that low risk transactions from legitimate customers aren't creating customer friction and increasing operational costs.
